Clarity Monthly Update

General Information

The 3rd Sunday of every month Visonex updates Clarity with fixes to issues reported and enhancements based on client feedback. Following is a general overview of those fixes and enhancements that occurred on Sunday, March 15, 2020 and additional changes approved by NKC's Change Control Board.

What's Fixed in Clarity

1. **Beginning Monday, March 23, Inpatient will become an "active" status allowing reports to automatically include hospitalized patients.** Staff will no longer have to use Advanced Mode in Report Wizard to manually add them to reports.

2. **All Social Work assessments now automatically create Patient Notes.**

3. **A "Primary Language" report was created to assist in identifying patients who do not have a primary language entered in General Information.**

What's New in Clarity

1. **Nurses are now able to document COVID-19 symptom screening and the plan/interventions taken during the treatment in Real-Time Charting (RTC) and Visit Management (V).** Nurses are able to add ICD 10 codes for COVID-19 specific conditions in the patient Problem List and manually enter lab confirmed test results in Laboratories. There are several reports available for tracking. For details, please refer to the Tip Sheet, "COVID-19 Documentation" located on KNET>Clarity>Tip Sheets.
   a. Visonex made some additional changes to the COVID-19 symptom screening and plan sections in RTC and VM that went into effect 3/23/20. The change in format required the creation of 3 additional temporary fields that pull the previous symptom screening, plan and lab confirmed positive dates recorded prior to 3/23/20. These temporary fields will be removed from RTC and VM when they are no longer necessary/useful. The date of the removal of the temporary fields has not yet been determined by NKC's Change Control Board.
   b. The change in the formatting of the COVID-19 sections makes it possible for the information recorded in RTC to flow to VM and vice versa.

2. **The Transplantation Module has been completely reconfigured and now consists of 3 separate sections; Transplant Information, Transplant Waitlist and Transplant Workup.** Visonex created the module in order to address a new CMS ESRD QIP measure for "Percentage of Prevalent Patients Waitlisted (PPPW)."
    a. **Transplant Information** is used to document specific data regarding a kidney transplant and will support more than 1 transplant.
    b. **Transplant Waitlist** is used to document information on Waitlists and will support multiple waitlists per patient and supports patient progress regarding Waitlist status.
    c. **Transplant Workup** is used to document a patient's interest, transplant candidate status and progress on workup. Information in this section can only be pulled from assessments. The Transplant assessment is currently in development.
    d. Although these 3 sections are currently active in Clarity, development of the standard work and the Transplant assessment are in progress. A Tip Sheet and WebEx live demonstration will be provided once NKC completes this process.
