

To our in-center patients

Starting June 30, we'll use an alcohol-based antiseptic to clean your skin before cannulation.

Here's why we're making this change:

It's gentler on your skin

*Less chance of causing irritation
or an allergic reaction*

It's safe and effective

*It works just as well as
chlorhexidine to prevent infection*

Already widely used

*Most dialysis clinics in the U.S.
use alcohol-based antiseptics*

Your safety and comfort matter to us!

If you have any questions, please talk to a member of your dialysis care team.
